Cancer Family History Survey

You are invited to complete this questionnaire in our efforts to recommend the most complete care for you.

Name: _____   Today's date: _____

Date of Birth: _____   Referring Dr.: _____

Best telephone: _____   Dr.'s telephone: _____

> Most of the time, cancer happens by chance. However, in some families cancer may be caused, in part, by changes in certain genes that can run in the family. These genetic changes significantly increase a person's risk for certain cancers, including a second cancer in those who have already had cancer. Both you and your family may benefit from this information, since hereditary cancer risk can be significantly reduced with various medical interventions. A careful review of your family history is an essential first step, so *please ✓ all boxes that apply to you, considering both living and deceased relatives.*

Condition	Patient	Siblings	Children	Mother	Father	# of Relatives on Mother's Side	# of Relatives on Father's Side
Breast cancer before age 50							
Breast cancer in a male							
Ovarian cancer at any age							
Breast cancer in 3+ relatives							
Breast cancer any age and Eastern European Jewish							
Uterine cancer before age 50							
Colorectal cancer before age 50							
Colorectal polyps before age 50							
10+ colorectal polyps total							
Pancreatic cancer at any age							
Medullary thyroid cancer							
Melanoma (especially if multiple and before age 50)							
Other, such as rare cancers or pheochromocytoma (please list):							

If you checked any of these boxes, you might have a personal or family history that is suggestive of a hereditary cancer syndrome. A cancer genetic risk assessment may be very helpful in understanding your risk and may change care recommendations for you and your family members. Counseling does not commit you to testing. To schedule an appointment with our certified genetic counselor, Vanessa Marcell, please notify a staff member or call her directly at 845-533-4951.
